THE 10 COMMANDMENTS OF MOSQUITO CONTROL

Empty, remove, cover or turn upside down any receptacle that would hold water particularly old bottles and tin cans.

Change water and scrub vases holding flowers or cuttings twice each week— or grow cuttings in sand

Discard old tires or store them in a proper place.

Screen rain barrels and openings to water tanks or cisterns. Seal cisterns not in actual use.

Repair leaky plumbing and outside faucets. They may cause standing water.

Connect open waste-water drains to a sewage system, or construct separate sump or leach.

Clean clogged roof gutters and drain flat roofs

Fill holes in tress with sand or mortar, or drain or spray them as required.

Stock ornamental ponds with mosquito eating fish.

Fix or repair screens for doors and windows

Check Your Yard & Home

STOP MOSQUITOES!

If there are any places around your home where water collects, such as water holding containers, house cooler drains, and ornamental ponds.

YOU MAY BE RAISING MOSQUITOES !

YOU SHOULD.....

Get rid of old tires, or stack and cover tires and store them in a proper place.

YOU SHOULD.....

Empty your tin cans, bottles, jars, buckets, drums and other containers.

YOU SHOULD.....

Repair leaky pipes, outside faucets, and move house cooler drain hoses frequently.

YOU SHOULD.....

Change water and scrub vases holding flowers or cuttings twice each week– or grow cuttings in sand; scrub and change water in bird baths twice weekly; empty watering pans of pets and chickens daily.

It's a fact that.....

All mosquitoes need water in which to pass their early life stages.....adult flying mosquitoes frequently rest in grass, shrubbery or other foliage, but they never develop there

Some mosquitoes lay their eggs in standing water where they hatch in a day or two. Other mosquitoes lay their eggs in old tires, tin cans, or other water holding containers in which may remain unhatched for weeks or months until they are covered with water. With both types of mosquitoes, the wigglers or larvae grow quickly and turn into tumblers or pupae. Soon the skin of the tumbler splits open and out climbs another hungry mosquito.
